VRG8691/92

Adjustable 7.5A Positive LDO Regulator Radiation Tolerant

www.aeroflex.com/voltreg

June 14, 2010

FEATURES

- Radiation performance
 - Total dose: 100 krad(Si),
Dose rate = 50 - 300 rad(Si)/s
- Output voltage adjustable: 1.0V to 3.3V
- Output current: 7.5A
- Dropout voltage: 0.5V at 7.5Amps
- Voltage reference: 1.0V \pm 0.5%
- Load regulation: 0.5% max
- Line regulation: 0.2% max
- Ripple rejection: >66dB
- Enable Input - TTL / CMOS Compatible
- Slow Start capability
- Packaging – Hermetic metal
 - Thru-hole or Surface mount
 - 12 Leads, 1.0"W x 0.9"L x .220"Ht
 - Power package
 - Weight - 18 gm max
- Designed for aerospace and high reliability space applications
- DSCC SMD 5962-09237 Pending

NOTE: Aeroflex Plainview does not currently have a DSCC certified Radiation Hardened Assurance Program

DESCRIPTION

The Aeroflex Plainview VRG8691/92 is capable of supplying in excess of 7.5Amps over the output voltage range as defined under recommended operating conditions. The regulator is exceptionally easy to set-up, requiring only 2 external resistors to set the output voltage. The module design has been optimized for excellent regulation and low drop-out voltage. Figures 2 through 5 illustrate setting output voltage, setting current limits and choosing a slow start capacitor. The VRG8691/92 serves a wide variety of applications including local on-card regulation, programmable output voltage regulation or precision current regulation.

The VRG8691/92 has been specifically designed to meet exposure to radiation environments. The VRG8691 is configured for a Thru-Hole 12 lead metal power package and the VRG8692 is configured for a Surface Mount 12 lead metal power package. It is guaranteed operational from -55°C to +125°C. Available screened to MIL-STD-883, the VRG8691/92 is ideal for demanding military and space applications.

CURRENT LIMIT (ICL)

The VRG8691/92 features internal current limiting making them virtually blowout-proof against overloads. The limit is nominally 11.5A @ $V_{in} = 5V$ (see Table 2), but may be increased or decreased with the addition of one external resistor (see Application Note 2). When the load current exceeds the ICL setting, the output of the VRG8691/92 will be latched in an OFF state. To reset the latch condition, the ENABLE function (pin 5) can be cycled, enabled - disabled - enabled, or the VBIAS may be cycled ON - OFF - ON (if the Figure 5 configuration is being utilized).

FIGURE 1 – BLOCK DIAGRAM / SCHEMATIC

ABSOLUTE MAXIMUM RATINGS

PARAMETER	RANGE	UNITS
Operating (Junction) Temperature Range	-55 to +150	°C
Lead Temperature (soldering, 10 sec)	300	°C
Storage Temperature Range	-65 to +150	°C
VBIAS, VIN	7	V
Thermal Resistance (Junction to case θ_{JC})	1	°C/W
Power	25 <u>1/</u>	W

1/ Based on pass transistor limitations of $(V_{IN} - V_O) \times I_O$ and $\theta_{JC} < 1^\circ\text{C/W}$ with 25°C max T_J rise and $T_c = +125^\circ\text{C}$.

NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only; functional operation beyond the "Operation Conditions" is not recommended and extended exposure beyond the "Operation Conditions" may effect device reliability.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	RANGE	UNITS
Output Voltage Range	1.0 to 3.3	VDC
Case Operating Temperature Range	-55 to +125	°C
Output Current	0 to 7.5	A
VBIAS	3.3 to 5.5 <u>1/</u>	VDC
VIN	1.8 to 5.5 <u>2/</u>	VDC

1/ VBIAS must maintain a level equal or above VIN but not fall below 3.3V

2/ Depending upon VOUT setting.

ELECTRICAL PERFORMANCE CHARACTERISTICS 1/

PARAMETER	SYM	CONDITIONS	MIN	MAX	UNITS
Reference Voltage	VREF	$V_{IN} = V_{BIAS} = 5V$, $\overline{\text{ENABLE}} = 0$, $0A \leq I_{OUT} \leq 7.5A$	0.995	1.005	V
Line Regulation	$\frac{\Delta V_{OUT}}{\Delta V_{IN}}$	$2V \leq V_{IN} \leq 3V$, $V_{OUT} = 1.0V$, $4.3V \leq V_{IN} \leq 5.3V$, $V_{OUT} = 3.3V$,	-	0.2	%/V
Load Regulation	$\frac{\Delta V_{OUT}}{\Delta I_{OUT}}$	$0A \leq I_{OUT} \leq 7.5A$	-	0.5	%
Ripple Rejection Ratio		$f = 120\text{Hz}$, $C_{LOAD} = 47\mu\text{F}$	66	-	dB
Dropout Voltage	VDROP	@ $\Delta V_{OUT} = 1\%$, $0A \leq I_{OUT} \leq 7.5A$	-	0.5	V
Adjustment Pin Current	IADJ		-	3	μA
Minimum Load Current	IMIN		-	0	mA
Current Limit <u>2/</u>	ICL		9.5	13.5	A
Long Term Stability <u>3/</u>	$\frac{\Delta V_{OUT}}{\Delta \text{TIME}}$		-	1	%
Supply Current (VBIAS)	IBIAS		-	15	mA

Notes:

1/ Unless otherwise specified, these specifications apply for post radiation: $V_{BIAS} = V_{IN} = 5V$, $V_{OUT} = 3.3V$, $I_{OUT} = 7.5A$ and $-55^\circ\text{C} < T_c < +125^\circ\text{C}$.

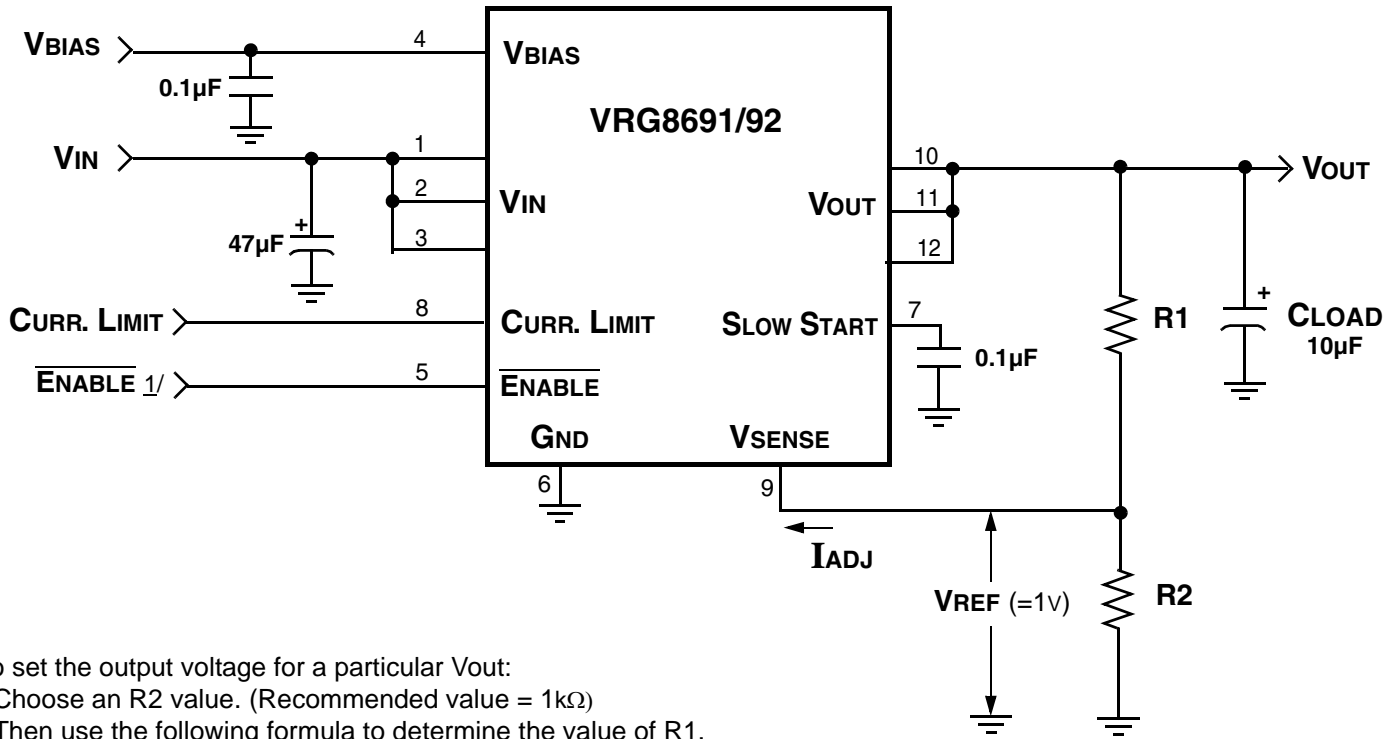

2/ Current Limit is adjustable as shown in Application Note 2, Figures 3 and 4.

3/ Not tested. Shall be guaranteed to the specified limits after 1000hr life test.

APPLICATION NOTE 1

BASIC SET-UP

Setting the output voltage (V_{OUT}):

- To set the output voltage for a particular V_{OUT}:
- Choose an R₂ value. (Recommended value = 1kΩ)
 - Then use the following formula to determine the value of R₁.

$$R_1 = R_2 \times \frac{V_{OUT} - V_{REF}}{(R_2 \times I_{ADJ}) + V_{REF}}, \text{ where } V_{REF} = 1V$$

Table 1 shows example values for R₁ and R₂ to achieve some standard voltages.
 Table 2 shows the nominal current limit settings if the 'CURR. LIMIT' function (pin 8) is left open.

Table 1
Example R₁ & R₂ for typical V_{OUT}

V _{OUT}	R ₂	R ₁
3.3V	1kΩ	2.3kΩ
2.5V	1kΩ	1.5kΩ
1.8V	1kΩ	800Ω
1.0V	1kΩ	0Ω

Table 2
2/

V _{IN}	I _{CL} NOM
5V	11.5A
3.3V	7.5A
2.5V	5.7A
1.8V	4.1A

Notes:

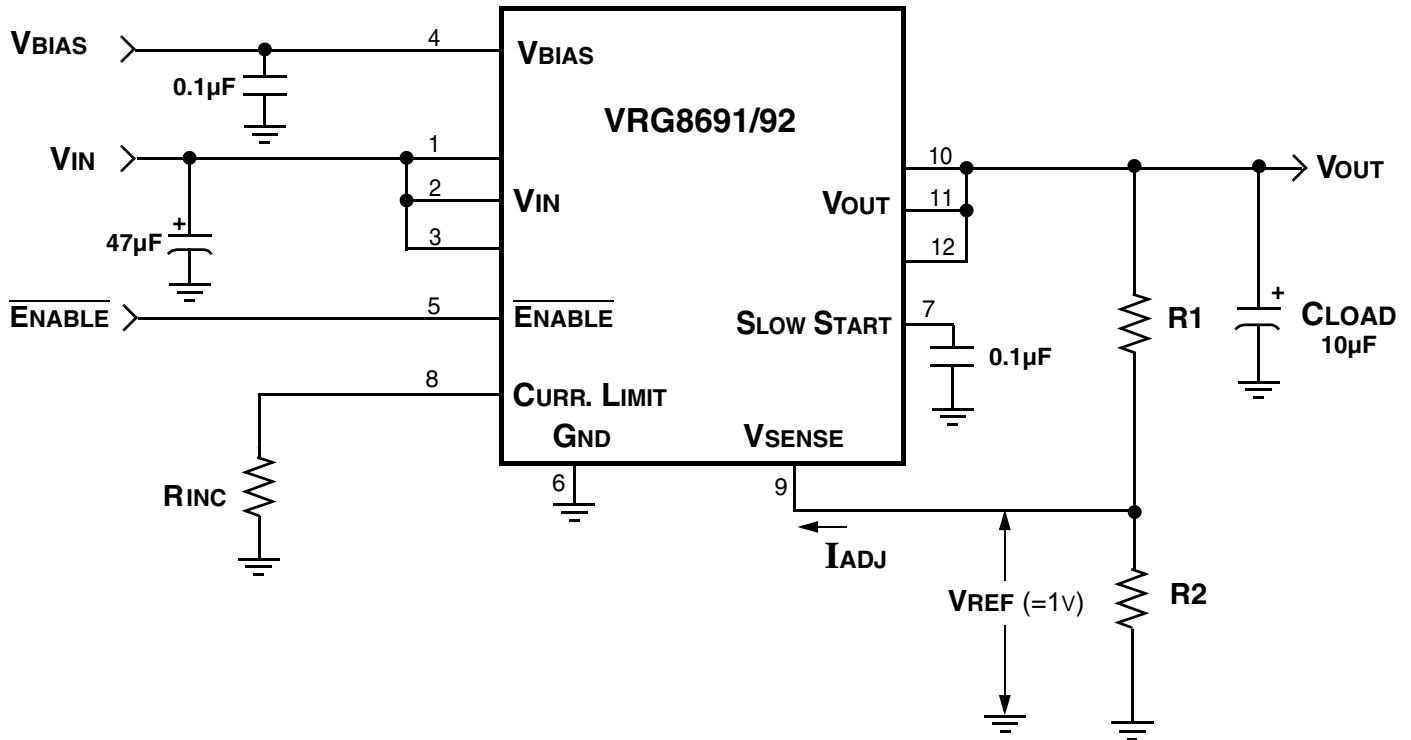

- 1/ ENABLE should be asserted after both V_{IN} and V_{BIAS} are applied.
 (See Application Note 3, Figure 5 for the configuration where a separate ENABLE control line is NOT required).
- 2/ I_{CL} varies directly with V_{IN}.
 (See Application Note 2 for adjusting the Current Limit, I_{CL}).

FIGURE 2 –SETTING OUTPUT VOLTAGE

APPLICATION NOTE 2

SETTING THE CURRENT LIMIT

To Increase the Current Limit (ICL):

- If the 'CURR. LIMIT' function (pin 8) is left open, the ICL decreases from 11.5 A(NOM) as VIN is decreased from 5V (Table 3).

Table 3

VIN	RINC	ICL NOM
5V	Open	11.5 A
3.3V	Open	7.5 A
2.5V	Open	5.7 A
1.8V	Open	4.1 A

- To increase the current limit above the nominal setting for any VIN and ICL combination, use the following formula:

$$RINC(K-OHMS) = \frac{30 \times V_{IN}}{\left(\frac{30 \times ICL}{69}\right) - V_{IN}}$$

- To maintain ICL at the 11.5 A setting, for commonly found VIN voltages, apply RINC value found in Table 4.

Table 4

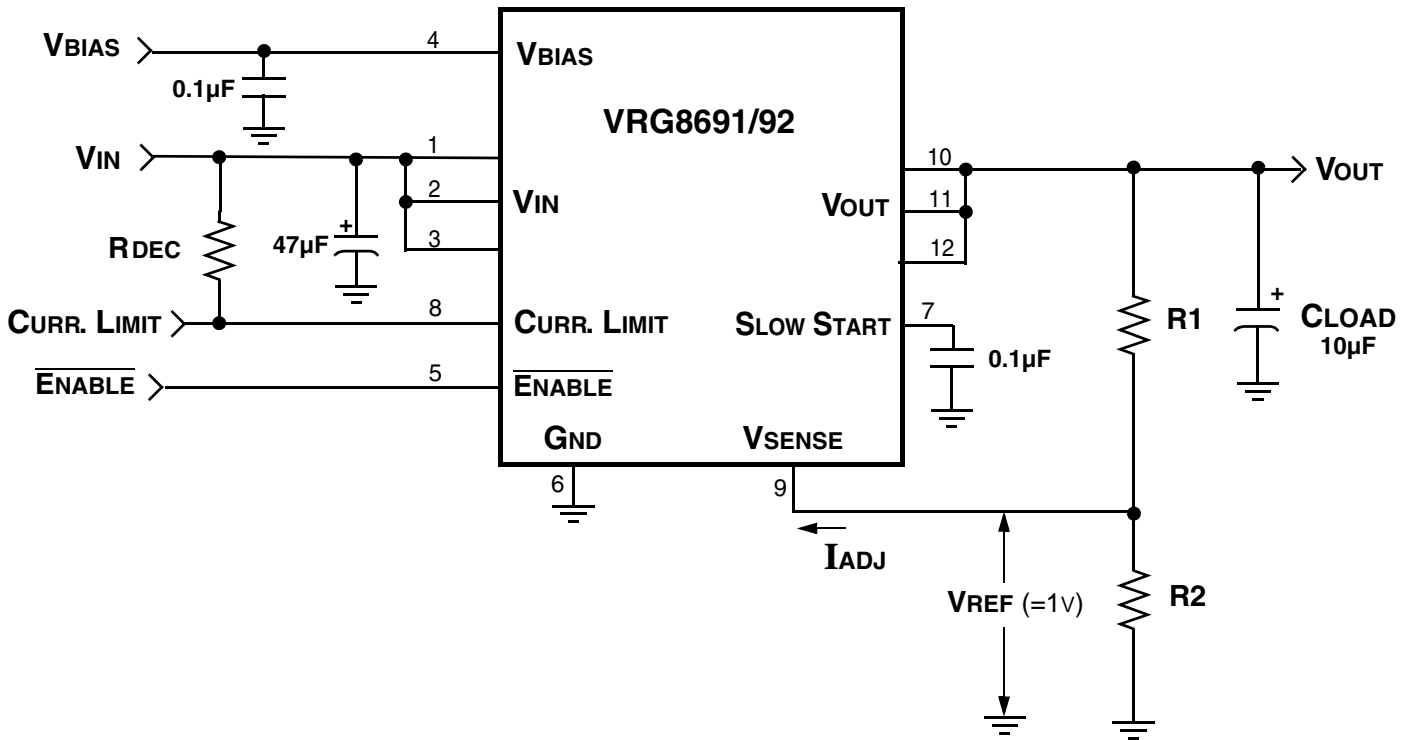

VIN	RINC	ICL NOM
5V	Open	11.5 A
3.3V	56kΩ	11.5 A
2.5V	30kΩ	11.5 A
1.8V	16kΩ	11.5 A

FIGURE 3 – INCREASING THE CURRENT LIMIT (ICL)

APPLICATION NOTE 2 (CONTINUED)

SETTING THE CURRENT LIMIT

To Decrease the Current Limit (ICL):

- As shown in Table 3, if the 'CURR. LIMIT' function (pin 8) is left open, the ICL decreases from 11.5 A(NOM) as VIN is decreased from 5V.

- To achieve any ICL, less than nominal, use RDEC which can be calculated using the following formula:

$$RDEC(K-OHMS) = \frac{31 \times V_{IN}}{\left(\frac{69 \times V_{IN}}{30}\right) - I_{CL}}$$

FIGURE 4 – DECREASING THE CURRENT LIMIT (ICL)

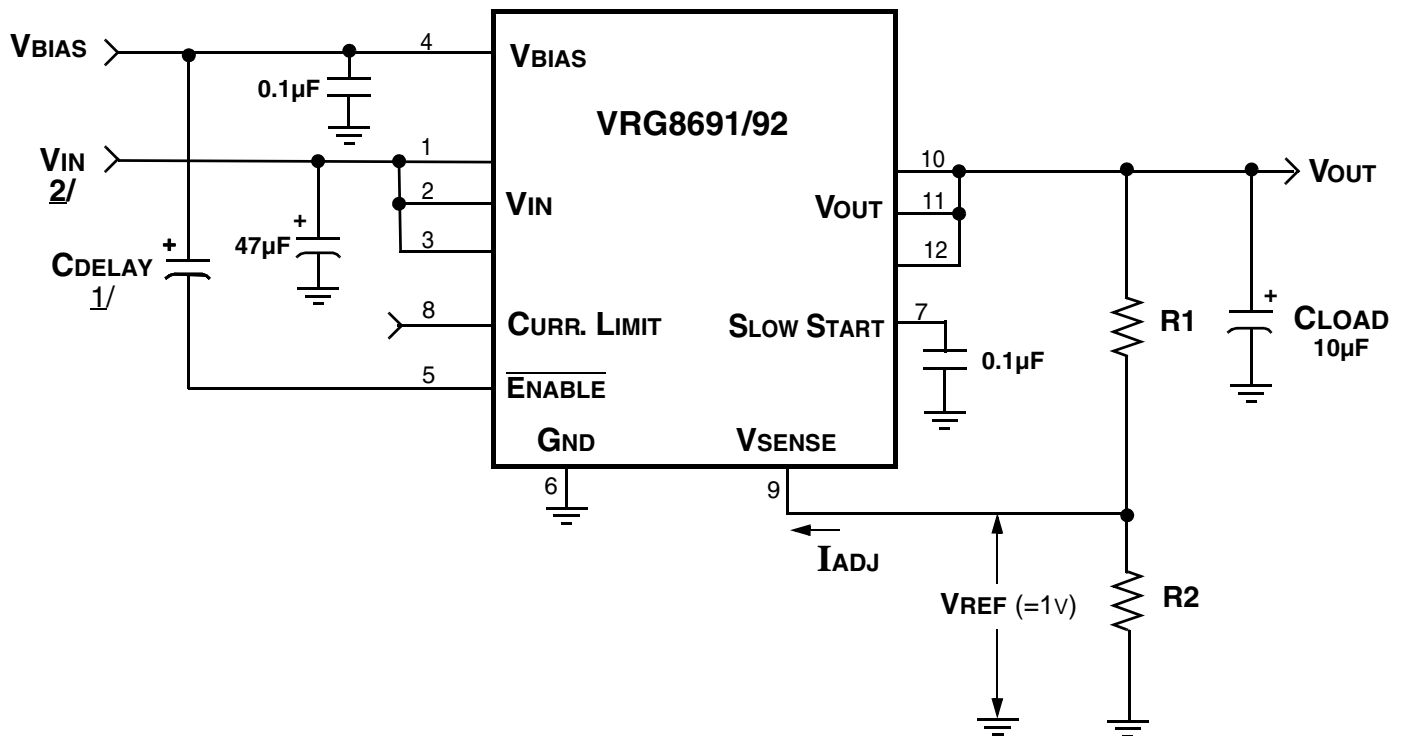

APPLICATION NOTE 3

START UP SEQUENCE

Recommended Power Supply Sequencing Options:

- OPTION 1: Controlling the $\overline{\text{ENABLE}}$ line with a Digital signal (TTL / CMOS compatible).
 - Prior to applying power, disable the regulator by setting the $\overline{\text{ENABLE}}$ control line to a HIGH state.
 - Apply V_{IN} and V_{BIAS} . 1/
 - Wait until both V_{IN} and V_{BIAS} supplies have reached their operating levels.
 - Toggle the $\overline{\text{ENABLE}}$ control line to a LOW state to turn on V_{OUT} of the regulator.
- OPTION 2: Controlling the $\overline{\text{ENABLE}}$ line using the CDELAY feature.
 - Connect a CDELAY capacitor between V_{BIAS} and the $\overline{\text{ENABLE}}$ as shown in Figure 5 below. 2/
 - Apply V_{IN} and V_{BIAS} . 1/
 - CDELAY causes the regulator to self-enable after V_{BIAS} has reached operating level.

NOTE: The $\overline{\text{ENABLE}}$ should always be asserted AFTER V_{IN} and V_{BIAS} have reached operating level.

NOTES:

- 1/ V_{IN} should be applied before V_{BIAS} if the Slow Start feature is used.
- 2/ CDELAY capacitor of 10uF is adequate for V_{BIAS} rise times of up to 50ms.

FIGURE 5 – DELAYED ENABLE

APPLICATION NOTE 4

V_{OUT} START UP RISE TIME CONTROL

Utilizing the Slow Start option:

When the VRG8691/92 is first powered up, using the Slow Start function controls the rate at which V_{OUT} rises to the required voltage set by R1 and R2.

Note: V_{IN} should be applied before V_{BIAS} when the Slow Start feature is used.

If it is desirable to control the output rise time, a capacitor (C_{SS}) can be asserted on the Slow Start pin to adjust the rise time for the following:

- A. Large load capacitance will cause high surge currents which will trip the current limit circuitry.
The use of C_{SS} will allow the output voltage to rise slowly thus mitigate the surge current phenomenon.

$$\frac{C_{SS}}{C_{LOAD}} > \frac{V_{OUT\ NOM}}{I_{CL} - I_{LOAD\ NOM}} \times \frac{0.4 \times V_{BIAS}}{1300}$$

- B. C_{SS} may be used solely to control V_{OUT} RISE TIME (T_r), when C_{LOAD} is not an issue.

$$T_R = C_{SS} \times 1300 \times \ln \left(\frac{V_{BIAS}}{V_{BIAS} - 2.5} \right) \quad \text{Note: } C_{SS} \text{ in Farads and } T_R \text{ in seconds.}$$

- C. C_{SS} is effective only when V_{IN} is applied prior to V_{BIAS} or \overline{ENABLE} .
